

Well, there are types of tests for this virus. One is the test, which you if you currently have the virus or not. The is an antibody test, which will tell you, later when you've got no symptoms, or not you had coronavirus. Many people get it without ever A number of companies and research institutes are working on antibody test, as our correspondent Fergus Walsh explains.

This is a home antibody test looks like. This is for HIV and can be online. It's this kind of accurate fingerprick test which is for coronavirus. An antibody test tell you if you've previously been infected with coronavirus and have up some immunity which protect you in future. The British behind the HIV test it hopes to have a similar one for coronavirus within weeks. I it would make an incredible difference. The everyone's asking themselves is, "Have I had it? I had a in January and I didn't very well", so for us, antibody detection is the key, really, to accelerating how we this.
